

Doc2Audio — Quick Start

Turn a document into spoken audio, with the reference codes stripped out. For Mac.

1

Put the files in one folder

Keep these together, e.g. in **Downloads/Doc2Audio**:

`doc2audio.py`

`Setup.command`

`Convert to Audio.command`

`README.md`

2

Run Setup once

Open **Terminal** (Cmd-Space → type “Terminal”), then paste this one line and press Return:

```
cd ~/Downloads/Doc2Audio && chmod +x *.command && ./Setup.command
```

It installs the audio tools and downloads the **Amy** voice (the same voice as the narrated explainers). A few minutes; it may ask for your Mac password.

3

Convert a document

Drag your file onto **Convert to Audio.command** — or double-click it and drag the file into the window, then press Return. Works with .docx, .pdf, .txt, .rtf, .md. You can drop several at once.

✓

Get your audio

The file is saved right next to your document, named **“YourDocument (audio).mp3”**. Double-click to play.

Good to know. This is a plain read-aloud with codes removed — it speaks the document’s own words minus document numbers, requirement IDs (e.g. SYS_1234), transmittals, revision codes, table-of-contents lines and page numbers. Meaningful short terms like L2, M2, E2E are kept. First time you open a downloaded **.command** file, if macOS blocks it: right-click → **Open** → **Open** (once per file).
